EDUCATION

B.S. Data Science Expected Graduation: May 2026

- Cumulative GPA 4.00, Arizona State University, Tempe, AZ

EXPERIENCE

Data Science Intern, Ectios August 2025 - October 2025

- Designed and built large-scale data pipelines integrating national (BDNS/IDAE), transmission (REE), and distribution (DSO) datasets across Spain's energy network
- Built automated ETL workflows in Python and AWS S3 to standardize heterogeneous geospatial capacity data into a unified, analytics-ready schema
- Developed APIs to serve real-time, location-based capacity insights, supporting downstream analytics and product use cases
- Implemented data validation and normalization logic to improve data quality and consistency across multiple grid levels and sources
- Collaborated on LLM-powered document extraction to structure incentive data, laying the groundwork for AI-driven analytics within the SolarBrio platform

Global Career Accelerator, Arizona State University January 2025 – May 2025

- Used SQL to extract, clean, and prepare data from multiple business datasets for scenario-based analysis
- Leveraged Python to perform exploratory data analysis (EDA) and identify trends and inefficiencies
- Created interactive dashboards in Tableau to visualize results and support strategic business decisions

Winter Bootcamp, Techeer December 2023 – January 2024

- Built REST APIs using Django and implemented a QR code generation service
- Learned containerization fundamentals and backend system architecture with Docker

CCPT (Combined Command Post Training) Exercise, Combined Forces Command April 2022

- Analyzed scenario-based simulation data to support operational decision-making during a joint U.S.-R.O.K. military exercise

PROJECTS

Credit Risk Prediction – PySpark Machine Learning Pipeline January 2026 – March 2026

- Built a machine learning pipeline using PySpark to predict loan default risk from financial and credit attributes
- Trained and evaluated Logistic Regression and Random Forest models, achieving ROC AUC ≈ 0.92
- Implemented data preprocessing, feature engineering, and missing value handling within a PySpark ML pipeline
- Scaled the workflow from Google Colab to a distributed GCP Dataproc cluster for large-scale data processing

Amazon Review Sentiment Classification – Machine Learning Project November – December 2025

- Analyzed 568K+ Amazon product reviews to build a large-scale binary sentiment classification system
- Designed an NLP pipeline with text preprocessing and TF-IDF feature engineering for sentiment classification
- Trained and compared Multinomial Naive Bayes and Logistic Regression, using hyperparameter tuning
- Improved minority-class performance, boosting Naive Bayes negative F1 from 0.26 to 0.71, and selected Logistic Regression as the final model

Bot Detection Model – Machine Learning Project April 2025

- Performed exploratory data analysis (EDA) in R to identify class imbalance, handle missing values, and select informative features
- Built a decision tree model to classify user accounts as bots or humans using preprocessed Kaggle dataset
- Visualized model accuracy and feature importance to interpret classification results effectively

TECHNICAL SKILLS

- Python (pandas, numpy, scikit-learn, PySpark), R, SQL, Google Cloud Platform (Dataproc), Tableau, AWS S3, Docker

Awards

- **Dean's List Awards** 2023 – 2025, 2019 – 2021
- **2022 Republic of Korea Armed Forces User-Generated Content : 3rd place** 2022
  Awarded by the Minister of National Defense (Republic of Korea)
- **New American University Scholar Scholarship** 2019 – 2021
